## Functions

OFF delay (R)
The supply voltage U must be constantly applied to the device (green LED U/t illuminated). When the control contact $S$ is closed, the output relay $R$ switches into on-position (yellow LED illuminated). If the control contact is opened, the set interval $t$ begins (green LED flashes). After the interval $t$ has expired (green LED U/t illuminated) the output relay switches into off-position (yellow LED not illuminated). If the control contact is closed again before the interval $t$ has expired, the interval already expired is erased and is restarted.
